Glycosylated and deoxyglycosylated derivatives of deoxynojirimycin (DNJ) were synthesized and their glycosidase inhibitory activities were compared with parent DNJ. Glycosylation of DNJ in its C-6 hydroxyl group generally afforded more active compounds than deoxyglycosylation at the same position. The glycosidase inhibitory activities of N-acetyl-DNJ were

Plant lectins have been implicated in a number of biological functions, including: attachment of symbiotic bacteria to the plant cell wall (phytohemagglutinins); attachment of the symbiotic bacteria to lysosomes in the host cell (beta-glucan recognition protein); participation in a calcium-dependent process of programmed cell death termed "proteinase-induced cell death" (lectins and calcium in plant cell death); and interaction of the plant with animal cells (receptors for the mannose-specific f-lectin from *Vicia villosa*). A lectin from the seeds of the coffee plant (*Coffea arabica* L.) is a tetrameric protein having a molecular weight of 27 kDa. The protein has two carbohydrate recognition domains (CRDs) and a subunit of molecular weight 31 kDa (Boyer, L., Science, 170: 1236-1239, (1970)). The two CRDs bind specific carbohydrates; one CRD recognizes galactose/N-acetylgalactosamine (Gal/GalNAc), the other CRD recognizes methyl-alpha-D-mannopyranoside (Man) (Boyer, L., Science, 170: 1236-1239, (1970)). A sequence analysis of the 28 kDa subunit of the coffee lectin indicates a probable, internally fuoreduced carbohydrate-binding domain with homology to the non-reducing end of the carboxyl
