I have the following question for my Physics class (in year 3) Suppose you have an object of mass m which is affected by a conservative force field $\vec{F}(x,y,z,t)$. We suppose this is a conservative field so that the work done by the field is equal to the change in potential energy: $\vec{F}(x,y,z,t) \cdot (\Delta \vec{r}) = - \frac{d}{dt} \int \vec{F}(x,y,z,t) \cdot \vec{r} \, \mathit{d}^3 \vec{r}$. Let us suppose the field is such that it depends only on time t and is independent of position \vec{r} . Then the equation of motion in position space is: $\frac{d^2 \vec{r}}{dt^2} = - \text{grad} \Phi(t)$ where $\Phi(t)$ is the potential energy of the system. I think that this is true, because the force is conservative, so the \vec{r} dependency is a property of the force. But my physics lecturer says that the position \vec{r} is treated like a velocity. I have a feeling that I am missing something obvious, so if
