Gibbscam 2013 Version v10.5.25.0 Multilanguage (x86/x64).. includes two powerful new options for CNC machining: - The 5-axis multi-blade option supports.Q: Making a Button act like ToggleButton in Xamarin Forms I'm currently making an Android app using Xamarin, and I wanted to ask if it's possible to make a Button act as a ToggleButton. I want the button to toggle between "Tapped" and "Un-Tapped". I've tried making a GestureRecognizer on the button, and it takes the code it executes when tapped. I would like to know if it's possible to make an Android Button act as a ToggleButton, with the functionality and style of a ToggleButton. Thank you! A: I'd look into a ToggleButton for the Android platform, since that's how it's typically done. You can build a custom element that uses the Android Button class, and attach it to a button on the layout and you should be fine. However, I'd recommend using Xamarin.Forms for this, and using toggle buttons the way the platform expects to use them: If you really need a different style (for example a rounded button), you can create a custom control and style it. More specifically, the present invention relates to a pulsating air conveyor which is particularly suitable for conveying bulk material in an environment of dust and sand. Bulk material, such as coal or ore, is normally conveyed using an air conveyor. Most prior art conveyors include a generally cylindrically-shaped air plenum including a plurality of blades, the plenum having an exit which is disposed at a level above a discharge conveyor. The blades are then configured to impart a pulsating force against the bulk material and cause the bulk material to move through the air plenum and onto the discharge conveyor. A prior art device for conveying bulk material is described in U.S. Pat. No. 4,369,115. In this device, the plenum is

disposed within a housing which includes a flume. The discharge conveyor is disposed within the flume. Bulk material is discharged through a throat portion of the housing above the discharge conveyor. The flume and plenum are only connected to the housing at one location where the flume enters the throat portion of the housing. The throat portion of the housing has a small cross-sectional area to facilitate the discharge of bulk material from the housing. Unfortunately, the prior art has several disadvantages. For example, since the flume is disposed within the housing, the housing is restricted in its ability to accommodate various discharge conveyors, such as discharge conveyors having various cross-sectional areas. Similarly, the housing is restricted in its ability to accommodate various flumes having various cross-sectional areas. Another disadvantage of the prior art is that the housing is limited in its ability to accommodate a plenum having a relatively large number of blades. More specifically, the housing is only connected to the plenum at a particular location where the discharge conveyor connects to the housing. As such, the plenum is in direct communication with the throat portion of the housing and the bulk material within the housing will separate the plenum from the air in the throat portion. In the case of coal, the coal may then clog the plenum and prevent the air from reaching the blades. It would therefore be desirable to provide an air conveyor which includes a housing
